Gemini Documentation

The websites chosen for the repository and the selection criteria

Technical documentation · British English
November 2026

1. Introduction

Gemini is Google's family of models and artificial intelligence assistant. In this repository its role is the **choice of websites** that make up WebAtlas. This documentation presents the tool, the criteria that can be observed in the selection, the list of the 68 chosen sites and an analysis of coverage.

The text describes the function assigned to Gemini in the project. Features and availability vary by plan, region and version; consult Google's official material for current details.

Tools in the repository

Tool	Role in this repository
Mullvad VPN	Network layer: privacy and security of the connection when exploring the Surface Web and, as a complement, the dark web
ChatGPT	Organisation of the repository: folder structure, naming and categorisation
Gemini	Choice of the websites that make up the repository
Claude	Writing documentation and reports

2. What Gemini Is

Gemini was introduced by Google in late 2023 as a family of multimodal models able to work with text, images, audio and code. The assistant of the same name succeeded the earlier Bard and is integrated into Google products such as Search, Android and the Chrome browser.

- **Research and synthesis**: gathering and summarising information from several sources.
- **Comparison**: contrasting services, platforms and institutions against defined criteria.
- **Integration with the Google ecosystem**: access to search and productivity features, depending on the plan.
- **Multimodal features**: analysis of images and documents.

3. Role in the Repository: Choosing the Sites

The choice of sites determines the reach of the atlas. The WebAtlas selection brings together 68 Surface Web sites, spread over twelve categories, seeking to balance popularity, diversity and relevance.

Criteria observable in the selection

- **Thematic coverage**: from social networks and the press to sport, government, security, technology and knowledge.
- **Geographical diversity**: sites from Brazil, the United States, the United Kingdom, Germany, Finland, Europe and international organisations.
- **Diversity of nature**: commercial companies, public bodies, non-profit organisations, community and open-source projects.
- **Relevance and reach**: high-audience platforms alongside technical and institutional references.

- **Varied risk profiles**: from everyday services to categories that call for more caution, such as betting and security.
- **Regional focus**: the presence of Brazilian sources, such as Folha de S.Paulo, G1, Agência Brasil, Gov.br and Polícia Federal.

4. Chosen Sites

Category	No.	Sites
Social-Networks	11	Facebook, Instagram, LinkedIn, X, TikTok, Pinterest, Snapchat, Threads, Mastodon, Bluesky, Discord
News	11	BBC, Folha de S.Paulo, New York Times, Reuters, Associated Press, CNN, Deutsche Welle, The Guardian, Al Jazeera, G1, Agência Brasil
Sports	8	ESPN, Olympics, UFC, FIFA, Formula 1, NBA, IBJJF, IJF
Betting	3	Bet365, Betano, Betfair
Government	6	Gov.br, USA.gov, GOV.UK, Portal da Transparência, Germany Gov, Finland Gov
Intelligence-Investigation	7	FBI, CIA, Europol, Interpol, NSA, CISA, Polícia Federal
Operating-Systems	10	Arch Linux, Debian, Windows, FreeBSD, Kali Linux, Ubuntu, Fedora, Linux Mint, OpenBSD, TempleOS
Communities	2	Reddit, Stack Overflow
Knowledge	3	Wikipedia, Internet Archive, NASA
Development-Technology	5	GitHub, Cloudflare, OWASP, Mozilla, GNU
Video-Platforms	1	YouTube
Web-Portals	1	Yahoo

Note: the list contains 68 sites. The folder identifiers belong to the repository's organisation; in this document, sites are cited by name only.

5. Analysis of the Selection

Strengths

- Thematic breadth: twelve different categories in a single atlas.
- A balance between commercial, public and community sources.
- A good presence of technical references, such as operating system distributions, OWASP, GNU and Mozilla.
- A mix of Brazilian and international sources, useful for comparisons.

Gaps and possible expansions

- E-commerce, banks and financial services.

- Search engines, beyond the Yahoo portal.
- Asian platforms and those from other regions, currently little represented.
- Music streaming and video on demand, beyond YouTube.
- Health, education and human rights organisations.
- A dedicated category for the dark web, supported by the Tor Browser documentation.

6. How Gemini Helps with Curation

- Identifying candidates for new sites in each category.
- Comparing candidates by reach, nature and relevance.
- Checking the existence and current state of a site, using search features.
- Summarising each site's purpose in a few lines, for the profiles.
- Suggesting under-represented categories.

7. Limitations and Precautions

- AI answers can contain errors or out-of-date data; confirm against primary sources.
- Sites change name, address and business model; record the date of verification.
- The choice of sites reflects project decisions, and including a site does not imply endorsement.
- Betting and security-body sites call for attention to scams and fake pages.

8. Good Practice

- Define criteria before asking for suggestions and record them.
- Require sources and check official addresses.
- Review the list periodically, removing inactive sites and adding new ones.
- Visit the sites over a protected connection, as set out in the Mullvad VPN documentation.

9. Conclusion

The list chosen with Gemini's support gives WebAtlas a broad and diverse foundation of the Surface Web. Recognising the gaps is part of the work: the atlas is a living project, and curation continues with each review.
