A simple, lightweight distribution

You've reached the website for **Arch Linux**, a lightweight and flexible Linux® distribution that tries to Keep It Simple.

Currently we have official packages optimized for the x86-64 architecture. We complement our official package sets with a community-operated package repository that grows in size and quality each and every day.

Our strong community is diverse and helpful, and we pride ourselves on the range of skillsets and uses for Arch that stem from it. Please check out our forums and mailing lists to get your feet wet. Also glance through our wiki if you want to learn more about Arch.

Latest News

Update to php ≥ 8.5.12 and/or php-legacy ≥ 8.3.36 to prevent remote code execution

2026-10-21

PHP versions prior to 8.5.12 and 8.3.36 are affected by CVE-2026-109618 and CVE-2026-109619, which allow for remote code execution.

For any system publicly exposing a PHP application with the help of a prior version of PHP, we urge users to upgrade those systems to the latest available version of PHP (php ≥ 8.5.12 and php-legacy ≥ 8.3.36) immediately.

Edit: For further details and instructions, please refer to the Arch Linux Security Advisories ASA-202610-1 and ASA-202610-2.

Update to ca-certificates-mozilla ≥ 3.131.1-1 to prevent man-in-the-middle attacks

2026-10-21

On 2026-10-20 it was revealed, that several certificates of the eMudhra intermediate Certificate Authority have been compromised.

The compromised certificates have been removed/invalidated with ca-certificates-mozilla ≥ 3.131.1-1.

Without an update to this central certificate bundle, systems are susceptible to man-in-the-middle attacks. As such, we urge everyone to upgrade their systems immediately.

Mkinitcpio >=42 requires manual intervention for TPM2-based unlocking of LUKS devices

2026-09-22

Starting with package version `42-1`, the mkinitcpio systemd hook now includes `systemd-pcrosseparator.service` (as intended by systemd v261).

This affects the measurements of PCR values `0-7`, `9` and `12-14`. If you configured the systemd hook and unlock LUKS partitions, that depend on these values, you need to re-enroll the TPM2 in use.

For guidance, please refer to systemd-cryptenroll(1), or the ArchWiki article on systemd-cryptenroll, when using pinned values. Refer to systemd-pcrlock(8), when relying on custom policies and a disabled `systemd-pcrlock-make-policy.service`.

virtualbox-ext-vnc >= 7.2.12-2 requires manual intervention

2026-07-21

Previously, we installed its contents in a way that made `pacman` not aware of the files (using `VBoxManage extpack install ...` from an install script). To mitigate issues during upgrade, you can use one of the following methods:

- Uninstall `virtualbox-ext-vnc` before upgrading the system, then installing it again.
- Run `VBoxManage extpack install --replace ...` as root before upgrading the system.
